

CABLE CONNECTIONS

Cable route markers

Document No.: 09-700-R1

Sheet: 1 of 1

German Cathodic Protection

Model 700

Upright cable route markers are used to indicate the location of buried cables as well as anode groundbeds, water, gas and oil pipelines. They provide visible above ground, indication of the position of underground service lines located below.

The stake marker can be installed either as a temporary sign during construction and removed after completion or as a permanent upright in areas where it will not obstruct traffic and where it is advantageous to see the marker from a distance.

Materials

Cableroute markers are made of a hot-dip galvanised profile steel 50 x 50 x 5 mm angle section.

The length above ground is 1.00 m, upright installation with a route marker plate on top and an identification plate at the bottom.

The marker plates are made of laminated plastic sheet (Trademark: ASTRALON A™) in three (3) layers (yellow, black, yellow) and two (2) mm thickness.

Yellow (RAL 1021) marker plates and black (RAL 9005) engraved letters.

Supplied with galvanised fixing bolts, nuts and washers.
